

# STAT406- Methods of Statistical Learning Lecture 18

Matias Salibian-Barrera

UBC - Sep / Dec 2017

# Ensembles

- Ensembles of classifiers
- Combine classifiers trained on the same (or similar [e.g. bootstrapped]) data
- Consensus is reached by (equally weighted) voting or averaged estimated probabilities.
- Bagging and Random Forests are examples of ensembles.

# Boosting

- Originally proposed for classification
- Main idea: sequentially re-train a simple classifier assigning more importance to points that were previously misclassified

# Boosting

- The end result is a weighted average of all the classifiers
- Interesting ideas:
  - Not all components of the ensemble are treated equally
  - Members of the ensemble use information about other members
  - The underlying loss function has a “margin” (unlike 0-1 losses)

# Boosting - AdaBoost.M1

**Algorithm.** Data  $(y_i, \mathbf{x}_i)$ , with  $y_i \in \{-1, 1\}$

- Set initial weights  $w_i = 1/n$ ,  $1 \leq i \leq n$
- For  $j = 1, \dots, K$
- Build a classifier  $T_j(\mathbf{x})$  to the data using weights  $w_i$ ,  $1 \leq i \leq n$

# Boosting - AdaBoost.M1

- Let

$$e_{\mathbf{j}} = \frac{\sum_{\mathbf{i}=1}^n w_{\mathbf{i}} I(y_{\mathbf{i}} \neq T_{\mathbf{j}}(\mathbf{x}_{\mathbf{i}}))}{\sum_{\ell=1}^n w_{\ell}}$$

- Let  $\alpha_{\mathbf{j}} = \log((1 - e_{\mathbf{j}})/e_{\mathbf{j}})$  and  
 $w_{\mathbf{i}} = w_{\mathbf{i}} \exp(\alpha_{\mathbf{j}} I(y_{\mathbf{i}} \neq T_{\mathbf{j}}(\mathbf{x}_{\mathbf{i}})))$ ,  $\mathbf{i} = 1, \dots, n$
- Final classifier:

$$T(\mathbf{x}) = \text{sign} \left( \sum_{\mathbf{j}=1}^K \alpha_{\mathbf{j}} T_{\mathbf{j}}(\mathbf{x}) \right)$$

# Error evolution - Spam data

AdaBoost error Vs number of trees

# Error evolution - Isolet

AdaBoost error Vs number of trees

# Boosting

- Boosting is fitting an **additive model**
- ... using a **forward search algorithm**
- ... and a **specific loss function**

# Boosting

- Think of classifiers of the form

$$G(\mathbf{x}) = \sum_{j=1}^K \beta_j f(\mathbf{x}, \gamma_j)$$

where  $f(\mathbf{x}, \gamma_j)$  are simple base classifiers (e.g. trees)

# Boosting

- Given a data set  $(y_i, \mathbf{x}_i), i = 1, \dots, n$

$$\begin{aligned} \min_G \sum_{i=1}^n L(y_i, G(\mathbf{x}_i)) &= \\ &= \min_{\beta, \gamma} \sum_{i=1}^n L(y_i, \sum_{j=1}^K \beta_j f(\mathbf{x}_i, \gamma_j)) \end{aligned}$$

where  $\beta = (\beta_1, \dots, \beta_K)'$  and  
 $\gamma = (\gamma_1, \dots, \gamma_K)'$

# Boosting

- Find approximate solutions sequentially
- Start with  $f_0(\mathbf{x}) = 0$
- `for(j in 1:K)`
- Find

$$(\beta_j, \gamma_j) = \arg \min_{\beta, \gamma} \sum_{i=1}^n L(y_i, f_{j-1}(\mathbf{x}_i) + \beta f(\mathbf{x}_i, \gamma))$$

- Let  $f_j(\mathbf{x}) = f_{j-1}(\mathbf{x}) + \beta_j f(\mathbf{x}, \gamma_j)$

# Counterexample

```
> set.seed(123)
> n <- 100
> x1 <- rnorm(n)
> x2 <- rnorm(n)
> y <- 2 - x1 + 6*x2 + rnorm(n, sd=.7)
> m1 <- lm(y~x1+x2)
> ( obj1 <- sum( resid(m1)^2 ) )
[1] 43.01311
>
> r1 <- y - mean(y)
> m2 <- lm(r1~x1-1)
> r2 <- resid(m2)
> m3 <- lm(r2~x2-1)
> ( obj2 <- sum( resid(m3)^2 ) )
[1] 109.3264
```
