STAT406- Methods of Statistical Learning Lecture 22

Matias Salibian-Barrera

UBC - Sep / Dec 2016

Clustering

Dissimilarity measures

- $d(a, b) \ge 0$
- d(a, b) = 0 iff a = b
- d(a, b) = d(b, a)
- $d(\mathbf{a}, \mathbf{b}) \leq d(\mathbf{a}, \mathbf{d}) + d(\mathbf{d}, \mathbf{b})$

Clustering

Dissimilarity measures

Euclidean distance – Lp distances

-
$$d(\mathbf{a}, \mathbf{b}) = \left[\sum_{j=1}^{k} \left| \mathbf{a}_{j} - \mathbf{b}_{j} \right|^{p} \right]^{1/p}$$

•
$$L_{\infty}$$
- $d(\mathbf{a}, \mathbf{b}) = \max_{1 < j < k} |\mathbf{a}_j - \mathbf{b}_j|$

Clustering

When $a_i \in \{0, 1\}$

 We can use the number of matches / mismatches

	0	1
0	а	b
1	С	d

- (b+c)/k = proportion of mismatches
- 1 d/k = 1 proportion of 1-1 matches
- Presence is more significant than absence: "person likes Kenneth J. Harvey"

Agglomerative methods

- 1. Start with n clusters, C_1, \ldots, C_n each with one point
- 2. Find the pair of closest clusters, C_a , C_b
- 3. Merge them into $C_{(ab)}$, find $d\left(C_{(ab)}, C_j\right)$ for all other clusters C_i
- 4. Repeat until all observations belong in one cluster

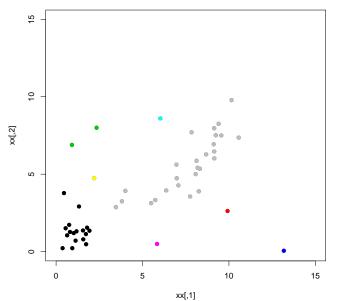

Agglomerative methods

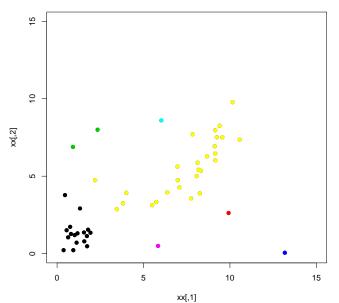

Different choices for $d(C_{(ab)}, C_j)$:

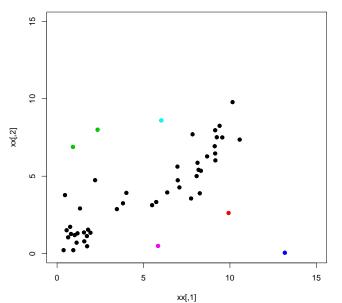

- Single linkage
- Complete linkage
- Average linkage
- Ward's "information" criterion

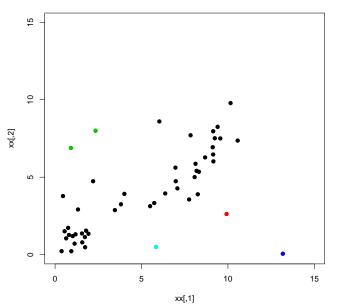

The **distance** between two **clusters** is the **minimum** distance between any **two elements**:

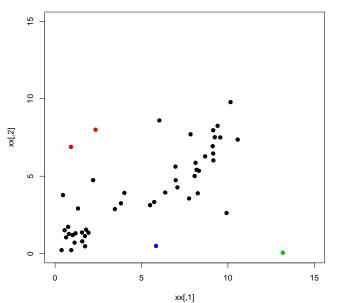

$$\mathcal{C}_1 = \{a_1, \dots, a_n\}$$
 $\mathcal{C}_2 = \{b_1, \dots, b_m\}$ $d(\mathcal{C}_1, \mathcal{C}_2) = \min \{d(a_1, b_1), d(a_1, b_2), \dots, d(a_n, b_m)\}$

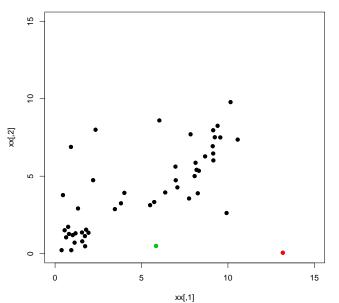

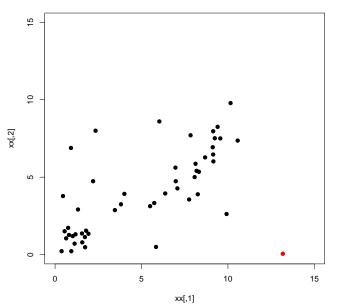

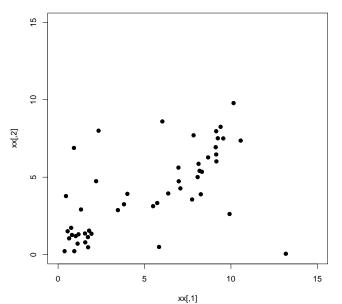

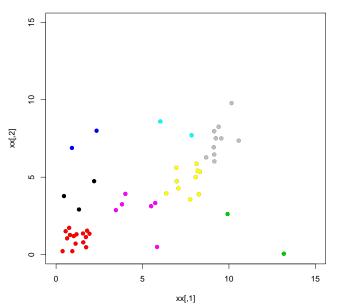

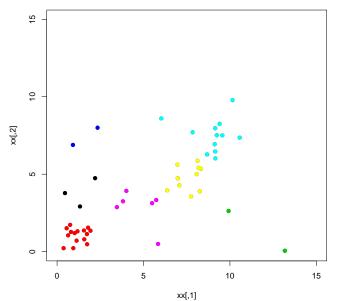

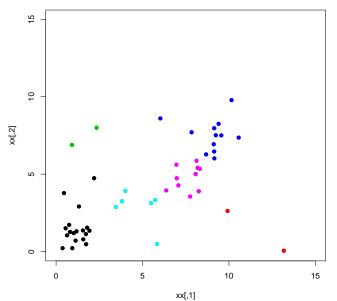

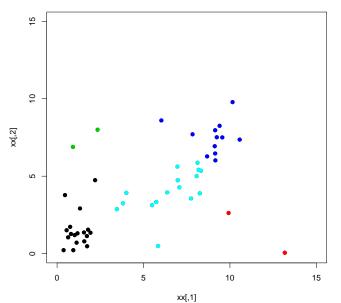

The **distance** between two **clusters** is the **maximum** distance between any **two elements**:

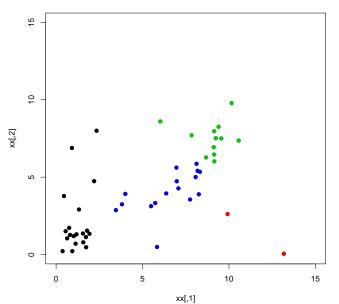

$$\mathcal{C}_1 = \{a_1, \dots, a_n\}$$
 $\mathcal{C}_2 = \{b_1, \dots, b_m\}$ $d(\mathcal{C}_1, \mathcal{C}_2) = \max \{d(a_1, b_1), d(a_1, b_2), \dots, d(a_n, b_m)\}$

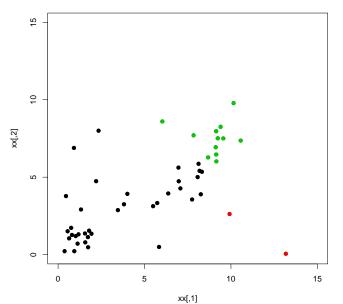

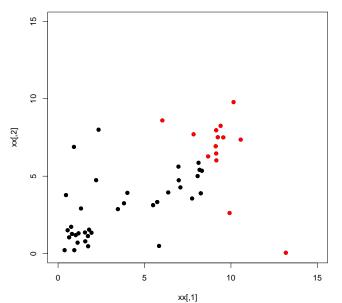

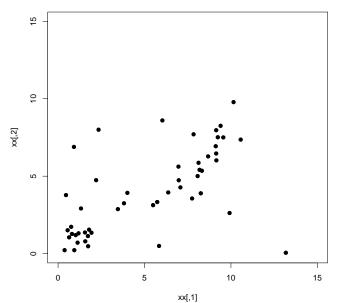

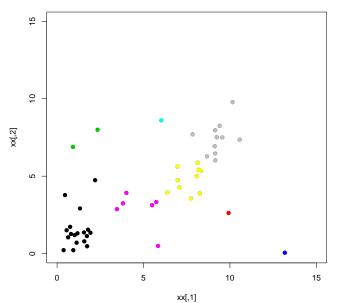

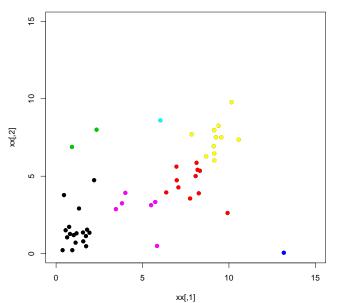

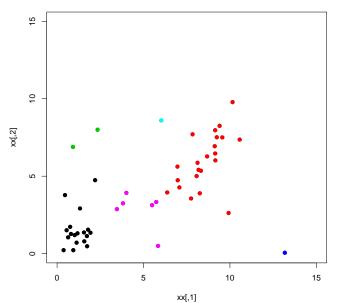

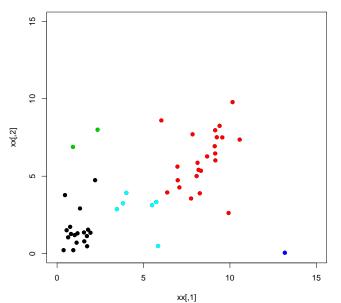

The **distance** between two **clusters** is the **average** of all pairwise distances between any **two elements**:

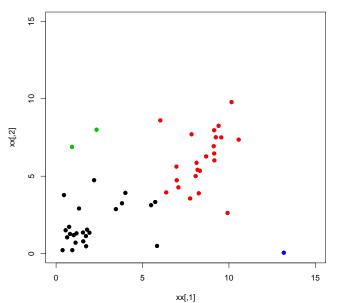

$$C_1 = \{a_1, \dots, a_n\} \qquad C_2 = \{b_1, \dots, b_m\}$$
$$d(C_1, C_2) = \frac{1}{nm} \sum_{i=1}^n \sum_{j=1}^m d(a_j, b_j)$$

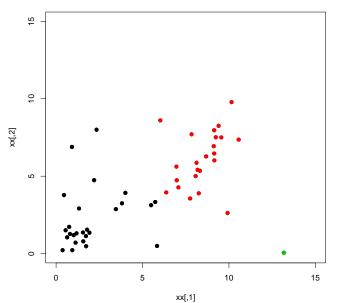

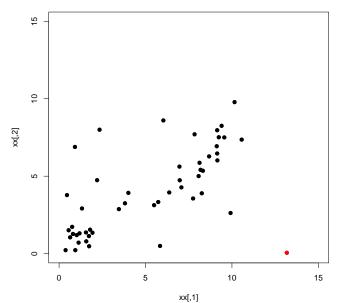

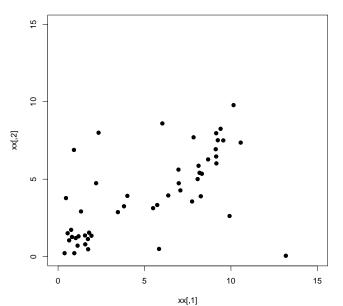

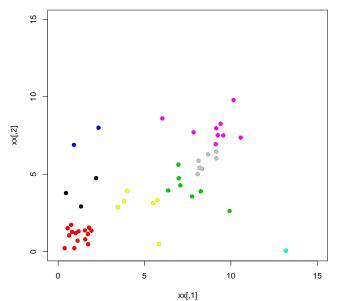

Ward's information criterion

A different merging criterion. Merge those two clusters that would result in the smallest increase in "within cluster sum of squares"

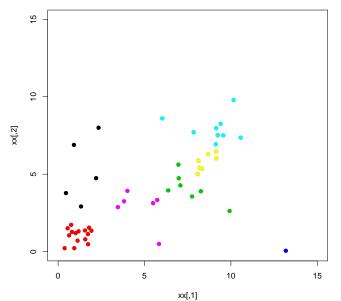

$$\mathsf{SS}\left(\mathcal{C}_r\right) \; = \; \sum_{i \in \mathcal{C}_r} \sum_{j \in \mathcal{C}_r} \, d\left(\mathbf{X}_i, \mathbf{X}_j\right)$$

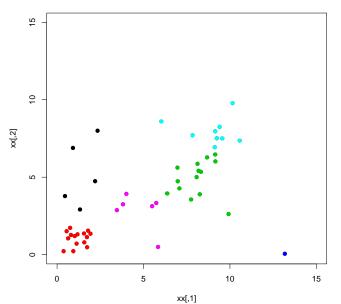

Total SS
$$= \sum_{r} SS(C_r)$$

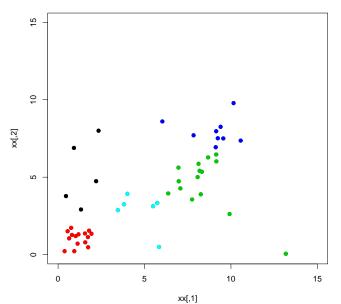

Ward's information criterion

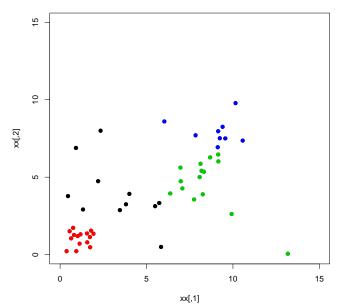

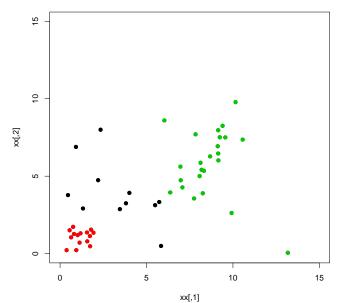

Ward's information criterion

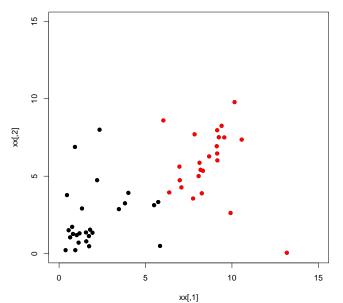

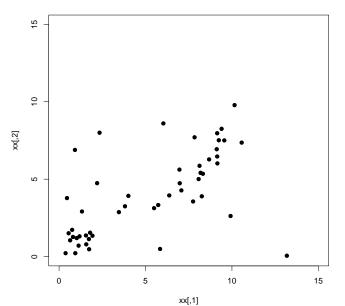

Languages

TABLE 12.3 NUMERALS IN 11 LANGUAGES

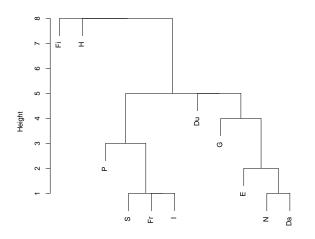

English (E)	Norwegian (N)	Danish (Da)	Dutch (Du)	German (G)	French (Fr)	Spanish (Sp)	Italian (I)	Polish (P)	Hungarian (H)	Finnish (Fi)

Languages - Single linkage

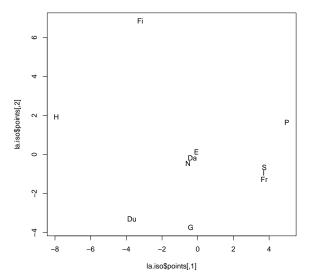

as.dist(a.la) hclust (*, "single")

Languages - Complete linkage

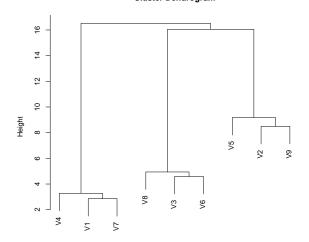

as.dist(a.la) hclust (*, "complete")

Languages - 2D representation via Multidimensional Scaling

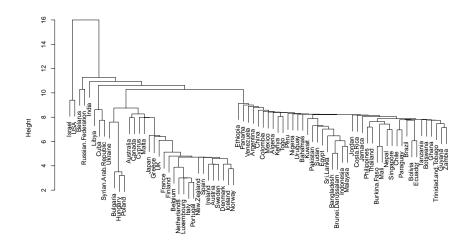

Breweries - Single linkage

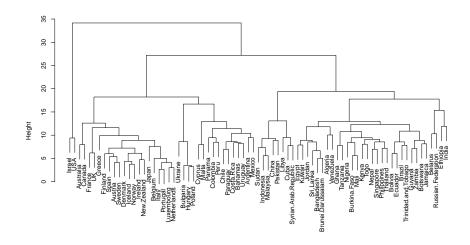

a.dis hclust (*, "single")

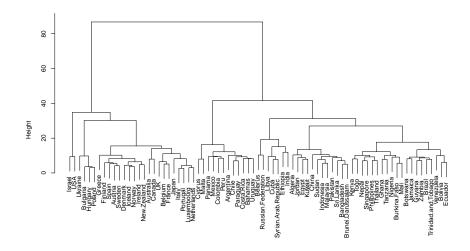

UN Votes - Single linkage

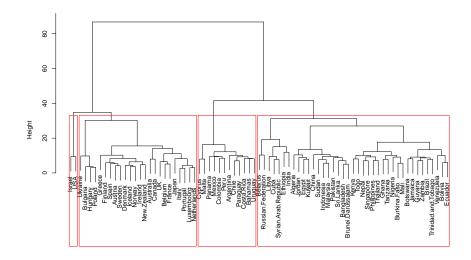

UN Votes - Complete linkage

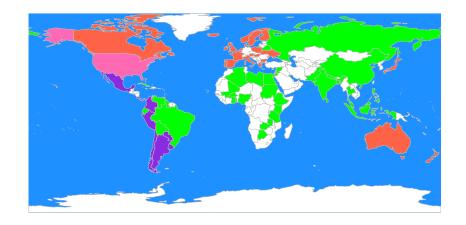

UN Votes - Ward linkage

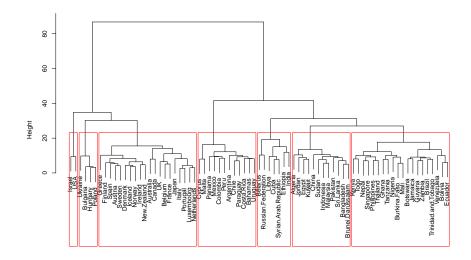

UN Votes - Ward linkage

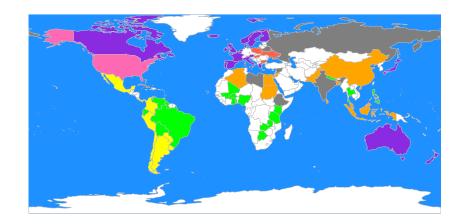

UN Votes - hierarchical - K=4

UN Votes - Ward linkage

UN Votes - hierarchical - K=7

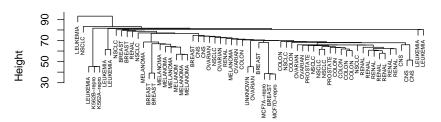

Cancer example

- Gene expression for 64 samples
- There are 6830 genes
- $\mathbf{X}_1, \, \mathbf{X}_2, \, \dots, \, \mathbf{X}_{64} \, \in \mathbb{R}^{6830}$
- We do know the label of each sample (which tissue this sample came from)
- The real problem is then "variable selection"

Cancer example - Single

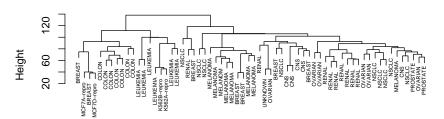

Cluster Dendrogram

nci.dis hclust (*, "single")

Cancer example - Complete

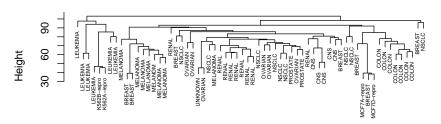

Cluster Dendrogram

nci.dis hclust (*, "complete")

Cancer example - Average

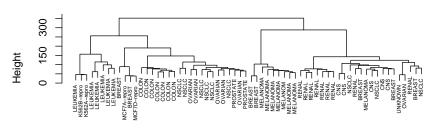

Cluster Dendrogram

nci.dis hclust (*, "average")

Cancer example - Ward

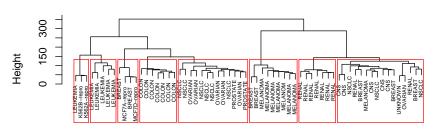

Cluster Dendrogram

nci.dis hclust (*, "ward")

Cancer example - Ward - 8 clusters

Cluster Dendrogram

nci.dis hclust (*, "ward")
